
Appendix 7-6
Collector Substation Layout

NOTES:

1. PRELIMINARY, NOT FOR CONSTRUCTION.
2. POWER TRANSFORMERS SHOWN ARE ILLUSTRATIVE ONLY. ACTUAL SIZE WILL VARY BY PROJECT REQUIREMENTS. TRANSFORMER SPACING & SEPARATION TO BE IN COMPLIANCE WITH IEEE 979 WHICH MAY INCLUDE A FIRE BARRIER WALL (50'>50,000gals OR 25'<50,000gals).
3. FENCE SHOWN IS ILLUSTRATIVE ONLY. PROJECT DESIGNS SHOULD PROVIDE ADEQUATE SPACE FOR VEHICULAR TRAFFIC, SHOULD WELL EXCEED THE MINIMUM CLEARANCE REQUIREMENTS OF NESC RULE 110.
4. YARD LIGHTING SHOWN IS A REPRESENTATION ONLY. A LIGHTING STUDY SHALL BE CONDUCTED DURING DETAILED DESIGN.
5. LIGHTNING MASTS SHOWN ARE REPRESENTATIVE ONLY. A DIRECT STROKE PROTECTION STUDY SHALL BE CONDUCTED DURING DETAILED DESIGN TO DETERMINE HEIGHT AND LOCATION OF MAST.
6. EMERGENCY GENERATOR LOCATION MAY VARY DEPENDING ON SITE AND DESIGN REQUIREMENTS.
7. CONTROL BUILDING LOCATION AND SIZE IS ILLUSTRATIVE ONLY. STATION DESIGN REQUIREMENTS MAY VARY PER AGREEMENT WITH AVANGRID.
8. CAP BANK SHOWN IS ILLUSTRATIVE ONLY. PROJECT DESIGNS SHOULD PROVIDE STUDY TO DETERMINE IF REQUIRED.

THE WALL-MOUNT™ AIR CONDITIONERS - 10.0 EER, (60HZ)

Models W18AA to W72AA Right-Side Control Panel
Models W18LA to W72LA Left-Side Control Panel
1.5 to 6 Ton (17,000 to 71,000 Btuh)

GREEN REFRIGERANT
R-410A

The Bard Wall-Mount Air Conditioner is a self contained energy efficient system, which is designed to offer maximum indoor comfort at a minimal cost without using valuable indoor floor space or outside ground space. This unit is the ideal product for versatile applications such as: new construction, modular offices, school modernization, telecommunication structures, portable structures or correctional facilities. Factory or field installed accessories are available to meet specific job requirements.

Engineered Features

Aluminum Finned Copper Coils:

Grooved tubing and enhanced louvered fin for maximum heat transfer and energy efficiency.

Twin Blowers:

Move air quietly. Most models feature multispeed blower motors providing airflow adjustment for high and low static operation. Motor overload protection is standard on all models.

Air Conditioner Compressor:

Scroll Compressors eliminate need for crankcase heater. Standard on all models, except 5-Ton.

R-410A Refrigerant:

Designed with R-410A (HFC) non-ozone depleting refrigerant in compliance with the Montreal protocol and 2010 EPA requirements.

Phase Rotation Monitor:

Standard on all 3-phase scroll compressors. Protects against reverse rotation if power supply is not properly connected. Rotation protection is not required on the 5-Ton Unit(s).

Galvanized 20 Gauge Zinc Coated Steel Cabinet:

Cleaned, rinsed, sealed and dried before the polyurethane primer is applied. The cabinet is handsomely finished with a baked on textured enamel, which allows it to withstand 1000 hours of salt spray tests per ASTM B117-03.

Foil Faced Insulation:

Standard on all units.

Full Length Mounting Brackets:

Built into cabinet for improved appearance and easy installation.

NOTE: Bottom mounting bracket included to assist in installation.

Electrical Components:

Are easily accessible for routine inspection and maintenance through a right side, service panel opening. Features a lockable, hinged access cover to the circuit breaker or toggle disconnect switch.

Electric Heat Strips:

Features an automatic limit and thermal cut-off safety control. Heater packages can be factory or field installed.

Filter Service Door:

Separate service door provides easy access for filter change.

One Inch, Disposable Air Filters:

Are standard equipment. Optional one inch washable filters available and filter racks permit the addition of 2" pleated filter. Factory or field installed.

Condenser Fan and Motor Shroud Assembly:

Slides out for easy access.

Barometric Fresh Air Damper:

Standard on all units. Allows up to 25% outside fresh air. Optional ventilation packages available.

Built-in Circuit Breakers:

Standard on all electric heat versions of single (230/208 volt) and three phase (230/208 volt) equipment. Toggle disconnects are standard on all electric heat versions of three phase (460 volt) equipment.

Slope Top:

Standard feature for water run-off.

Top Rain Flashing:

Standard feature on all models.

Freezestat:

Standard on W72 models. Optional field installed CMC-29 can be used on all other models.

Liquid Line Filter Drier:

Standard on all units. Protects system against moisture.

Compressor Control Module:

Standard on all units. Built-in off-delay timer adjustable from 30 seconds to 5 minutes. 2-minute on-delay if power interrupt. 120-second bypass for low pressure control, and both soft and manual lockouts for high and low pressure controls. Alarm output for alarm relay.

High & Low Pressure Switches are Auto-Reset:

Standard on all units. Built-in lockout circuit resets from the room thermostat. Provides commercial quality protection to the compressor.

Bard is an
 ISO 9001:2008
 Certified Manufacturer

- Complies with efficiency requirements of ASHRAE/IESNA 90.1-2013.
- Certified to ANSI/ARI Standard 390-2003 for SPVU (Single Package Vertical Units).
- Intertek ETL Listed to Standard for Safety Heating and Cooling Equipment ANSI/UL 1995/CSA 22.2 No. 236-05, Fourth Edition.
- Commercial Product - Not intended for Residential application.

Ventilation System Packages

Bard Wall-Mounts are designed to provide optional ventilation packages to meet all of your ventilation and indoor air quality requirements. All units are equipped with a barometric fresh air damper as the standard ventilation package. All ventilation packages can be built-in at the factory or field-installed at a later date.

Barometric Fresh Air Damper

MIS-3754

BAROMETRIC FRESH AIR DAMPER - WBFAD

STANDARD

The barometric fresh air damper is a standard feature on all models. It is installed on the inside of the service door and allows outside ventilation air, up to 25% of the total airflow rating of the unit, to be introduced through the air inlet openings and to be mixed with the conditioned air. The damper opens during blower operation and closes when the blower is off. Adjustable blade stops allow different amounts of outside air to be introduced into the building and can be easily locked closed if required.

BLANK OFF PLATE - WBOP

OPTIONAL

A blank off plate is installed on the inside of the service door. It covers the air inlet openings, which restricts any outside air from entering the unit. The blank off plate should be utilized in applications where outside air is not required to be mixed with the conditioned air.

Motorized Fresh Air Damper

MIS-3755

MOTORIZED FRESH AIR DAMPER - WMFAD

OPTIONAL

The motorized fresh air damper is internally mounted behind the service door and allows outside ventilation air, up to 25% of the total airflow rating of the unit, to be introduced through the air inlet openings and to be mixed with the conditioned air. The two position damper can be fully open or closed. The damper blade is powered open by a 24VAC motor with spring return on power loss. The damper can be controlled by indoor blower operation or can be field connected to be managed based on building occupancy.

NOTE: The above vent systems are intake only without built-in exhaust capability. Building will likely require separate field installed barometric relief or mechanical exhaust elsewhere within the conditioned space. Balancing dampers in the return air grille may be required to achieve specified amount of outdoor air intake.

Commercial Room Ventilator

MIS-3756

COMMERCIAL ROOM VENTILATOR - WCRVPS

OPTIONAL

The built-in commercial room ventilator is internally mounted behind the service door and allows outside ventilation air, up to 100% of the total airflow rating of the unit. It includes a built-in exhaust air damper for room pressurization relief.

The commercial room ventilator (CRV) is a simple and innovative approach to improving the indoor air quality by providing fresh air intake and exhaust capability through the CRV. The damper can be easily adjusted to control the amount of fresh air supplied into the building. The CRV can be controlled by indoor blower operation or field controlled based on room occupancy. Two versions available (except on 1.5 and 2-Ton models). The CRV and CRVS are power open - spring return on power loss, with positive shut-off. Complies with ANSI/ASHRAE Standard 62.1 "Ventilation for Acceptable Indoor Air Quality".

Standard Features:

- Fully modulating
- Honeywell Hi-Torque Actuator with 0-10V signal input capability
- Hood not required.
- Simple single blade design
- Positive shut-off with non-stick gaskets
- Solid State Controller with occupancy CFM setting and modulating 4-20 mA thermostat signal input

Economizer

MIS-3757

ECONOMIZER – WECO Series

OPTIONAL

The built-in economizer is internally mounted behind the service door and allows outside ventilation air, up to 100% of the total airflow rating of the unit. It includes a built-in exhaust air damper for room pressurization relief. The economizer is designed to provide "free cooling" when outside air conditions are cool and dry enough to satisfy cooling requirements without running the compressor. This in turn provides lower operating costs, while extending the life of the compressor.

Standard Features:

- Full rated outdoor intake
- Fully modulating
- Honeywell Hi-Torque Actuator
- 7" intake hood with filter
- Simple single blade design
- Positive shut-off with non-stick gaskets
- Electronic DB and/or Enthalpy sensors depending upon version
- Honeywell JADE electronic economizer module with precision settings and diagnostics
- DB or Enthalpy economizer versions available

Energy Recovery Ventilator

MIS-3758

WALL-MOUNT ENERGY RECOVERY VENTILATOR - WERV

OPTIONAL

The wall-mount energy recovery ventilator (ERV) is a highly innovative approach to meeting indoor air quality ventilation requirements as established by ANSI/ASHRAE Standard 62.1. The ERV allows from 200 to 450 CFM (depending upon model) of fresh air and exhaust through the unit while maintaining superior indoor comfort and humidity levels. In most cases this can be accomplished without increasing equipment sizing or operating costs. Heat transfer efficiency is up to 67% during summer and 75% during winter conditions.

The ERV consists of a unique "rotary energy recovery cassette" that provides effective sensible and latent heat transfer capabilities during summer and winter conditions. Various control schemes are addressed including limiting ventilation during building occupancy only.

The ERV is designed to be internally mounted behind the service door in the W**A or W**L model wall-mount units. It can be built-in at the factory (W**A only) or field installed as an option. ERVP-*3 and ERVP-*5 can be independently adjusted for intake and exhaust rates.

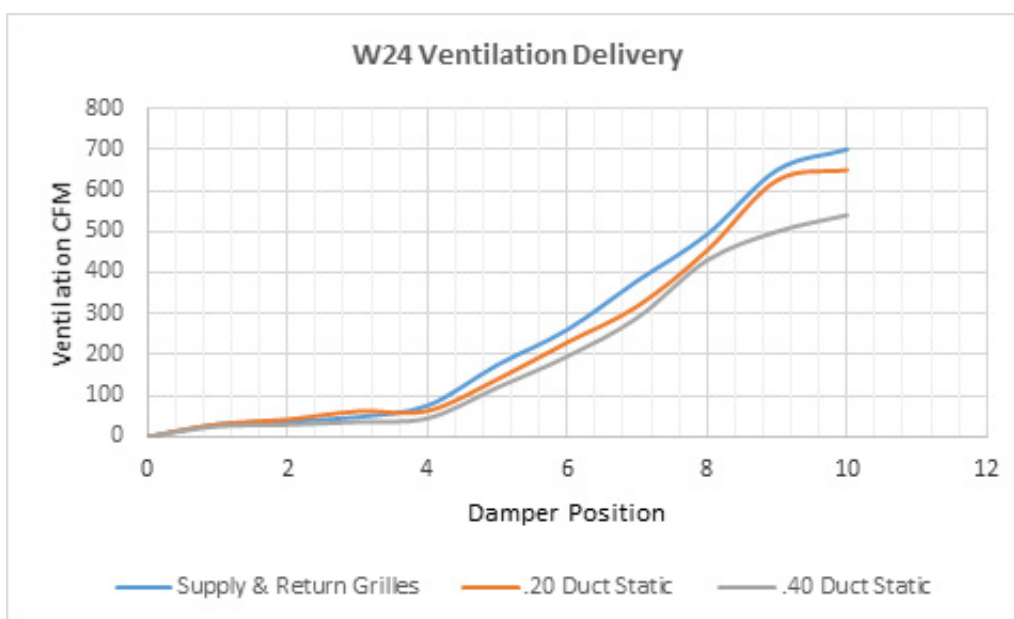

The ERV's have exhaust gravity shut-off dampers and motorized air intake dampers for positive shut-off.

Wiring includes plug-in harnesses for easy vent installation and removal.

Economizer Performance Data

① Maximum size of the time delay fuse or circuit breaker for protection of field wiring conductors.

② Based on 75°C copper wire. All wiring must conform to the National Electrical Code and all local codes.

③ These "Minimum Circuit Ampacity" values are to be used for sizing the field power conductors. Refer to the National Electrical code (latest version), Article 310 for power conductor sizing.

* Top outlet supply option is available only factory installed and only on the selected models.

CAUTION: When more than one field power circuit is run through one conduit, the conductors must be derated. Pay special attention to Note 8 of Table 310 regarding Ampacity

Adjustment Factors

when more than three current carrying conductors are in a raceway.

IMPORTANT: While this electrical data is presented as a guide, it is important to electrically connect properly sized fuses and conductor wires in accordance with the National Electrical Code and all local codes.

STD	STD	STD				•			Field Installed Only	SK111 Except W60 & 72 SK121 W72 Only SK122 W60 Only

STD = Standard equipment for these specified models.

- ① HPC. High pressure control is auto reset. Always used with compressor control module (CCM) which is included. See note ③.
- ② LPC. Low pressure control is auto reset. Always used with compressor control module (CCM) which is included. See note ③.
- ③ CCM. Compressor control module has adjustable 30-second to 5-minute delay-on-break timer. On initial power-up, or any time the power is interrupted, the delay-on-make will be 2-minutes plus 10% of the delay-on-break setting. There is no delay-on-make during routine operation of the unit. The module also provides the lockout feature (with 1 retry) for high and/or low pressure controls, and a 2-minute timed bypass for low-pressure control.
- ④ LAC. Low ambient control permits cooling operation down to 0°F. LAC is fan-cycling control for outdoor fan motor on all models except W18 & W24 units, which have modulating control.
- ⑤ ALR. The alarm relay has a set of normally open and normally closed dry contacts to provide the ability to signal a condition of shutdown on either high or low pressure controls.
- ⑥ SK. PTCR start kit can be used with all -A single phase models. Increases starting torque 2-3x. Not used for -B or -C three phase models. Do not use if SK111 or SK121 is used.
- ⑦ SK. Start capacitor & potential relay start kit can be used with all -A single phase models. Increases starting torque 9x. Not used for -B or -C three phase models. Do not use if CMC-15 is used.
- ⑧ ODT. Outdoor thermostat is adjustable from 0 to 50°F. It is suitable for use as a compressor cut-off thermostat.
- ⑨ DDC. Incorporates 4 additional sensors: discharge air temperature, indoor blower airflow, compressor current, and dirty filter. These sensing devices function to input analog data such as temperature, as well as digital data such as airflow, compressor status or filter status. Special economizer required; consult factory.
- ⑩ "V" control module for use with field-supplied DDC. Refer to "V" Module document F1605 for more information.
- ⑪ W18AA & W24AA units use modulating LAC kit CMA-33

Appendix 7-7

Manufacturer Sound Level Data Sheets

This Appendix has been entirely REDACTED

Appendix 7-8
Cumulative Analysis

A cumulative short-term sound level modeling analysis was conducted using the Cadna/A noise calculation software which incorporates the ISO 9613-2 international standard for sound propagation. For this modeling scenario, cumulative impacts for projects that are currently existing and/or proposed by the time of filing the application within a two (2)-mile radius from any wind turbine or substation proposed for the facility were taken into consideration. In total, there were two surrounding projects, which were taken into consideration while determining cumulative impacts on the proposed Project. The two surrounding projects were:

- Cohocton Wind, and
- Baron Winds.

Cohocton Wind is an existing project, located to the north and west of the Prattsburgh Wind Project. Baron Winds is a two phased proposed project to be located to the west and south of the Prattsburgh Wind Project. Baron Winds received an Article 10 Certificate of Environmental Compatibility and Public Need from the New York State Board of Electric Generation, Siting, and the Environment on September 12, 2019 (the “Certificate”). Via sources of publicly available information, the Applicant was able to obtain information in relation to the layouts, turbine manufacturers, sound power level specifications and turbine heights regarding both surrounding projects. The list of wind turbine manufacturers, hub heights, and rotor diameters examined for this cumulative assessment are presented below in Table 7-8.1, with respect to Cohocton Wind and Baron Winds.

For the cumulative short-term sound level analysis, the maximum sound power level available was applied for both Cohocton Wind and Baron Winds, in order to determine wind turbine sound pressure levels during conditions when worst-case sound power levels are expected assuming all three projects proceed to commercial operation as currently proposed. For the Cohocton Wind¹ project, there is only one wind turbine type incorporated into the built project layout: Clipper C96. Under peak sound level producing conditions, the Clipper C96 (Cohocton) wind turbine has an A-weighted sound power level of 103.0 dBA. For Baron Winds², there are currently three wind turbine types incorporated into the proposed project layout: V150-4.2, G144-2.625, and the N117-3.675. Various mitigation modes are expected to be applied to specified wind turbines across the Baron Winds project. Mitigation modes identified in the sound modeling study have been applied to each individual wind turbine. Under peak sound level producing conditions, the Vestas V150-4.2-wind turbine has an A-weighted sound power level of 106.9 dBA. Under peak sound level producing conditions, the Gamesa G114-2.625 wind turbine has an A-weighted sound power level of 108.6 dBA. Under peak sound level producing conditions, the Nordex N117-3.675 wind turbine has an A-weighted sound power level of 105.5 dBA. Sound power level octave-band

¹ Hessler Associates, Inc, 2007. *Updated Noise Modeling Results Based on New Data From Clipper Windpower*. Cohocton Wind Farm Project. Cohocton, NY.

² RSG, 2021. *Baron Winds Supplemental Sound Modeling*.

frequencies were not provided for the Baron Winds turbines. As a result, this analysis was performed solely on a broadband basis for the Total Project and the two surrounding projects. These sound power levels for each wind turbine type are also presented in Table 7-8.1.

In addition to the wind turbines, substations are incorporated into both Cohocton Wind and Baron Winds. As a result, they have also been incorporated into the cumulative analysis. At Baron Winds, a single transformer for its substation with a sound power level of 94.9 dBA is expected. At Cohocton Wind, two substations currently exist, as provided by the Applicant. The first substation contains a transformer rated at 125 MVA. The second substation transformer is rated at 140 MVA. Epsilon has conservatively estimated the sound emissions for both transformers using the techniques in the Electric Power Plant Environmental Noise Guide (Edison Electric Institute). For a summary of the Cohocton Wind and Baron Winds substation transformers see Table 7-8.2.

All modeling inputs and assumptions made earlier in Section 7(d), were also used in this cumulative analysis. For Prattsburgh Wind, of all seven wind turbine models analyzed, the N155-4.5 wind turbine contained the highest broadband sound power level. As a result, the (Unmitigated) N155-4.5 wind turbine design layout was applied to this cumulative analysis. These inputs and assumptions were implemented in the Cadna/A software for this modeling scenario to ensure conservative results (i.e., higher sound levels). In addition, for conservatism, an uncertainty “K-factor” of two (2) dBA was applied to all wind turbines across all three projects.

With respect to the Cohocton Wind and Baron Winds projects, only wind turbines within 2 miles of any proposed Prattsburgh Wind turbines were input into the Cadna/A cumulative short-term sound level modeling. A total of 40 surrounding wind turbines were included in the analysis, along with the three substations. A total of fifteen wind turbines were included from Cohocton Wind. A total of twenty-five wind turbines were included from Baron Winds.

Sound pressure levels due to the operation of all 36 Prattsburgh wind turbines and the collector substation transformer for the Project, along with the 40 wind turbines and three substations due to the Cohocton Wind and Baron Winds projects were modeled at 2,336 discrete receptors within and surrounding the Project area. The sound levels calculated are L_{eq} (8-hour) sound levels. In addition to modeling at discrete points, sound levels were also modeled throughout a large grid of receptor points, each spaced 20 meters apart to allow for the generation of sound level isolines. Tabular results and sound level isolines were calculated and generated for the entire Project area.

Table 7-8.1 Wind Turbines Analyzed for Cumulative Sound Level Assessment

Surrounding Project Name	Manufacturer	Wind Turbine Model	Hub Height (m)	Rotor Diameter (m)	Broadband Sound Power Level (dBA)
Cohocton Wind	Clipper	C96	80	96	103.0
Baron Winds	Vestas	V150-4.2	120	150	106.9
Baron Winds	Gamesa	G114-2.625	93	114	108.6
Baron Winds	Nordex	N117-3.675	91	117	105.5

Table 7-8.2 Substations Analyzed for Cumulative Sound Level Assessment

Surrounding Project Name	Transformer MVA Rating	Relative Height (m)	Broadband Sound Power Level (dBA)
Cohocton Wind	125	4	99.8
Cohocton Wind	140	4	100.5
Baron Winds	N/A	3	94.9

Tables in Appendix 7-8 show the predicted “Cumulative” short-term broadband (dBA) sound levels under conditions specified in Section 7(d). The results are sorted by receptor ID and sorted by A-weighted sound level high to low, and then are broken down by receptor type (Residential, Unknown, Public & Other) and participation (Non-Participating, Potentially Participating, Participating (Limited), and Participating). In total, there are twenty-six (26) tables total sorted by modeling receptor ID and sorted by A-weighted sound level high to low for the designed Project layout. In addition, the tables display the predicted “Project Only” short-term broadband (dBA) sound levels from Appendix 7-4. As a result, the predicted “Baron Winds & Cohocton Wind” contribution to the short-term broadband (dBA) sound levels is the difference between the two. The tables present modeled 8-hour L_{eq} sound levels at the 2,336 receptors included in the analysis. The cumulative broadband sound levels range from 23 to 79 dBA across all receptors. The highest cumulative L_{eq} (8-hour) sound levels at residential receptors are:

- Non-Participating Receptor ID# 2333 - 48 dBA (Project Only: 31 dBA; Baron Winds & Cohocton Wind: 48 dBA)
- Potentially Participating Receptor ID# 1924 - 44 dBA (Project Only: 44 dBA; Baron Winds & Cohocton Wind: 19 dBA)
- Participating (Limited) Receptor ID# 1964 - 46 dBA (Project Only: 39 dBA; Baron Winds & Cohocton Wind: 45 dBA)

- Participating Receptor ID# 735 - 54 dBA (Project Only: 54 dBA; Baron Winds & Cohocton Wind: 18 dBA)

For all participating and potentially participating residences, the cumulative sound levels remain below 55 dBA L_{eq} (8-hour). In total, there are only six non-participating residences and one participating (limited) residence above 45 dBA L_{eq} (8-hour). For six of the non-participating residences (2333, 1940, 96, 1963, 2410, 310) and the one participating (limited) residence (1964) the Prattsburgh Wind contribution to the cumulative noise impacts are minor, as the sound contributions from Baron Winds & Cohocton Wind are already at or above 45 dBA L_{eq} (8-hour) for these residences. The addition of the Project will result in a 1 dBA increase or less at these receptors. This level of increase is not discernable. The one exception to this, will be at the one remaining non-participating residence (1963) where the cumulative sound level is 46 dBA L_{eq} (8-hour), the Project's contributions are 45 dBA L_{eq} (8-hour), and the Baron Winds & Cohocton Wind are 40 dBA L_{eq} (8-hour). This results in an increase of 6 dBA due to the Project's contributions, however, it is only 1 dBA above 45 dBA L_{eq} (8-hour). This is not a significant contribution and is only observed at one non-participating residence across the entire Project area. It is also the Applicant's understanding, that Cohocton Wind is in the process of repowering. This would result in newer and more modern technology on the wind turbines, which would reduce the cumulative sound impacts on the seven identified residences from Cohocton Wind.

In addition to these discrete modeling points, sound level contours generated from the modeling grid are presented in an overview figure, Figure 7-8.1, accompanied by a series of inset maps that provide a higher level of detail at all modeled receptors.

Table 7-8.1a: Cumulative Total Project Sound Level Modeling Results (Leq (8-Hour)) at Discrete Points - Sorted by Receptor ID [Residential and Non-Participating Receptors]

Appendix 7-11
Glossary of Terms

This section includes some of the terms used throughout the report which may require a more detailed explanation.

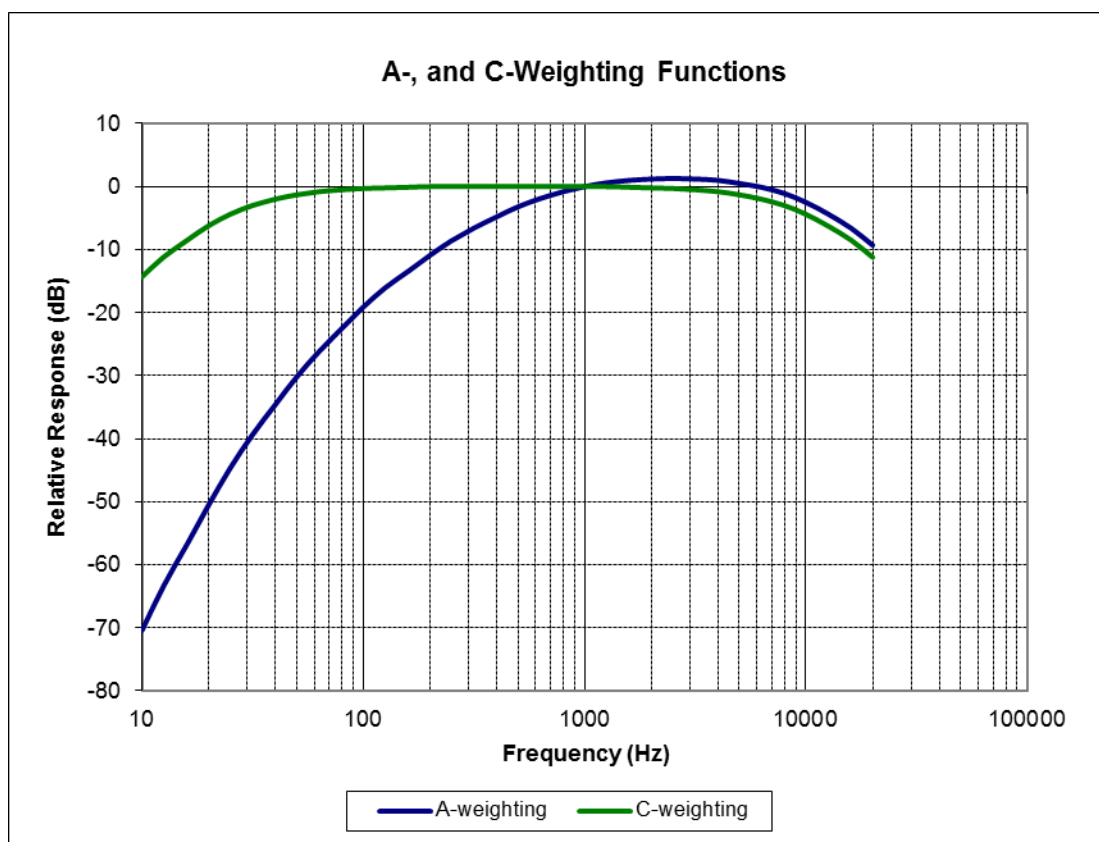

ANS-weighted	A high-frequency natural sound (HFNS) filter applied to the measured one-third octave-band data to remove seasonal noise like insects. This technique removes all sound energy above the 1,250 Hertz frequency band. The methodology for the filtration process is specified in ANSI/ASA S12.100-2014 and the sound pressure levels presented using this methodology are indicated as ANS-weighted levels (presented in dBA).
G	The portion of ground that is considered porous as defined under ISO 9613-2. This is used as part of the ground attenuation calculation between the source and receiver. For example, a G-factor of 0.5 corresponds to “mixed ground” consisting of half hard and half porous ground cover. A G-factor of zero (0) corresponds to “hard ground” consisting of surfaces with low porosity including water, and a G of 1 represents all porous ground.
Intensity (Loudness)	<p>Sound intensity is a measure of how much energy or power is transmitted. Humans do not perceive increases in sound level (loudness) in a linear manner. For this reason, sound levels are quantified in terms of a logarithmic ratio between the sound pressure of a given noise and the minimum sound pressure discernable by the human ear. This ratio is called the sound pressure level (L_p) and is always reported on a decibel (dB) scale.</p> <p>The logarithmic dB scale accommodates the wide range of sound intensities found in the environment. For example, 0 dB is the minimum discernable sound pressure at 2.9×10^{-9} lbs/in², while 140 dB is the threshold of pain at 0.029 psi. The ratio of the two sound pressures is 10,000,000, but there is only a 140-dB difference when using the logarithmic scale.</p>
Infrasound	Sound in the frequencies below 20 Hz.
ISO 9613-2	An international standard which specifies an engineering method for calculating the attenuation of sound during outdoor propagation in order to predict the levels of environmental noise at a distance from a variety of sources. The method predicts the equivalent continuous A-weighted sound level under

meteorological conditions favorable to propagation from sources of known sound emission, and is used throughout the United States and the world.

L_{eq}	The equivalent sound level is the level of a hypothetical steady sound that would have the same energy (<i>i.e.</i> , the same time-averaged mean square sound pressure) as the actual fluctuating sound observed. The equivalent level is designated L_{eq} and is also A-weighted. The equivalent level represents the time average of the fluctuating sound pressure, but because sound is represented on a logarithmic scale and the averaging is done with linear mean square sound pressure values, the L_{eq} is mostly determined by occasional loud noises.
L_n	Or nth percentile, is the sound level exceeded “n” percent of the time during a measurement period. For example, if 100 sound levels were measured over a 10-minute period, and were sorted from highest to lowest, the L_{90} would be the 90 th lowest of the 100 values. The L_{90} is close to the lowest sound level observed. It is essentially the same as the residual sound level, which is the sound level observed when there are no obvious nearby intermittent noise sources. The L_{10} is the sound level exceeded only 10 percent of the time. It is the 10 th lowest of the 100 samples described above. It is close to the maximum level observed during the measurement period.
L_{max}	The maximum sound level over a given time period. The L_{max} is typically due to discrete, identifiable events such as an airplane overflight, car or truck pass by, or a dog bark for example.
Low frequency	Sound contained in the frequencies from 20 Hz to 200 Hz.
Octave bands	The International Standards Organization (ISO) has agreed upon “preferred” frequency bands for sound measurement and by agreement the octave band is the widest band for frequency analysis. The upper frequency limit of the octave band is approximately twice the lower frequency limit and each band is identified by its geometric mean called the band center frequency. The octave band center frequencies typically used for sound level analyses are 31.5, 63, 125, 250, 500, 1000, 2000, 4000, and 8000 Hz. When more detailed information about a noise is required, standardized one-third octave band analysis may be used.

Weighting

The sound level meter used to measure noise is a standardized instrument.³ It contains “weighting networks” to adjust the frequency response of the instrument to approximate that of the human ear under various conditions. One network is the A-weighting network, which most closely approximates how the human ear responds to sound as a function of frequency, and is the accepted scale used for community sound level measurements. Sounds are frequently reported as detected with the A-weighting network of the sound level meter in dBA. A-weighted sound levels emphasize middle frequencies (i.e., middle pitched—around 1,000 Hertz sounds), and de-emphasize lower and higher frequencies. The C-weighting network has a nearly flat response for frequencies between 63 Hz and 4000 Hz and is noted as dBC. These are shown graphically below.
